

Learner Lane Web App:

LearnerLane is a web application designed to help South African learners aged 16-25 prepare for their K53 learner's licence through a simple, engaging and modern study experience. Traditional materials are often overwhelming, so LearnerLane breaks down the content into visual, roadmap-style sections covering Road Signs and Rules of the Road, with quizzes after each section to reinforce learning and track progress. The app is responsive and mobile-friendly, making it accessible across devices and reducing learner anxiety. Technically, the frontend is built using React.JS as a single-page application, styled with Tailwind CSS, and navigated via React Router to load only the necessary pages dynamically. Data is stored in Airtable, which acts as a cloud-hosted backend accessed using Axios through Airtable's REST API, and the entire application is deployed using Netlify. This stack was chosen for its simplicity, performance and alignment with my skill set, offering a smooth and focused user experience with no login required and minimal distraction.
